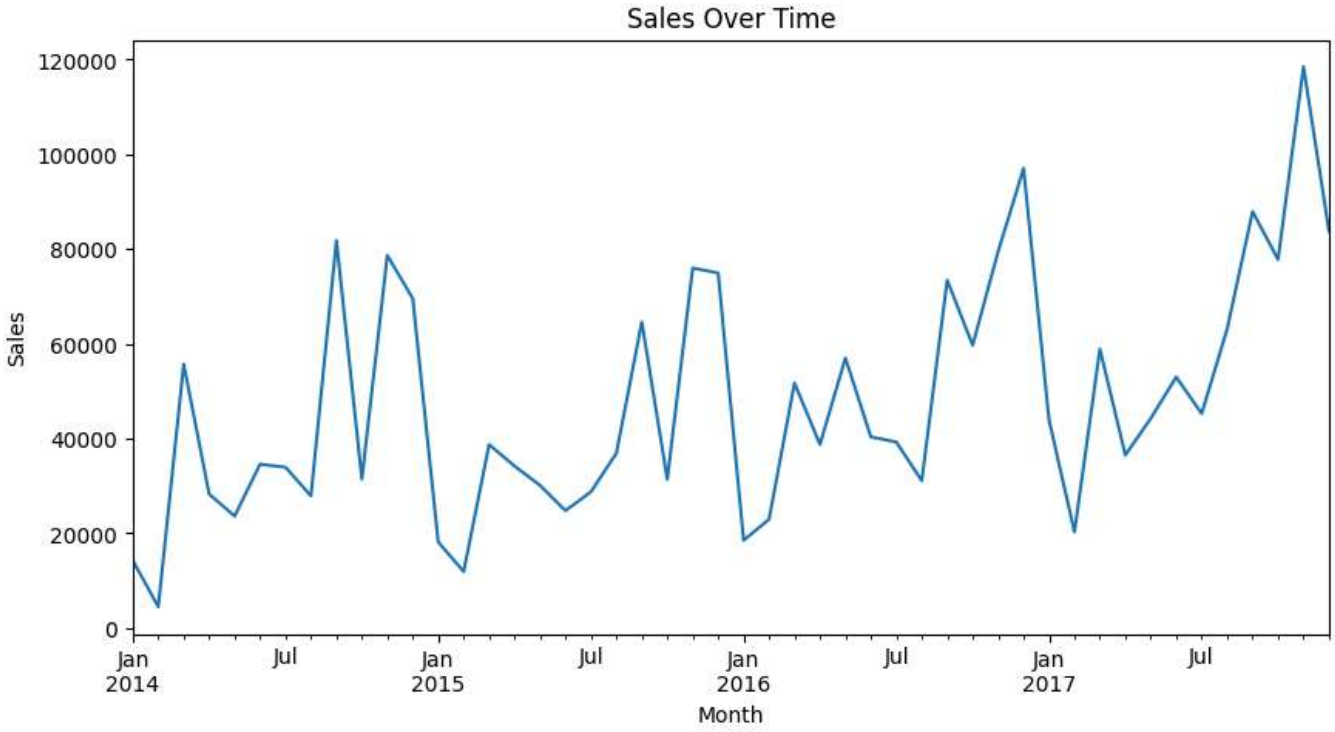
Summary of Findings

Objective

The objective of this analysis is to explore retail sales data to identify key trends, patterns, and factors influencing sales and profitability. This includes analyzing sales over time, comparing performance across product categories and regions, and examining relationships between variables such as sales, profit, and discount. The goal is to derive actionable insights that can support better business decision-making.

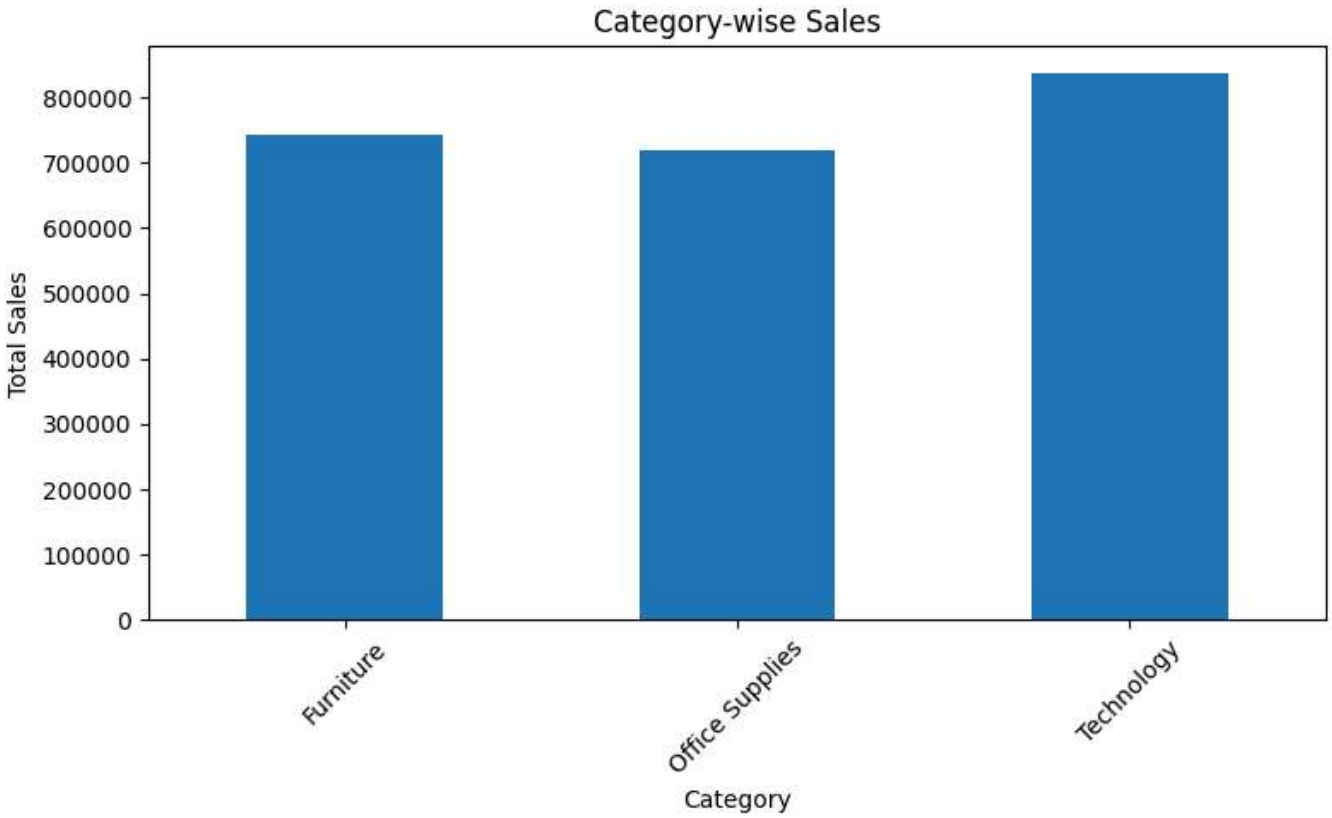
Visual Insights

Sales Over Time



Sales show an overall upward trend with noticeable fluctuations over time. Certain months exhibit peak performance, indicating seasonal demand patterns. This suggests opportunities for better inventory planning and targeted promotions during high-demand periods.

Category-Wise Sales



Sales distribution across categories shows clear differences in performance. Certain categories contribute significantly more to total sales, indicating strong customer demand, while others generate comparatively lower revenue. This suggests that the business should focus on high-performing categories for growth while exploring strategies to improve or optimize underperforming categories.

Final Findings & Business Insights

1. Sales over time show a fluctuating but overall increasing trend, indicating periods of peak demand and possible seasonality in customer purchasing behavior.
2. Category-wise analysis reveals that certain categories contribute significantly more to total sales, making them key drivers of business revenue.
3. The variation in sales across categories suggests an imbalance in product performance, highlighting opportunities to improve underperforming segments.

Business Recommendations

• Focus marketing and inventory efforts on high-performing categories to maximize revenue
• Analyze peak sales periods to plan promotions and optimize stock availability
• Develop strategies (pricing, promotions, bundling) to improve sales in lower-performing categories
